

WarehouseGate — Application Architecture

.NET 8 solution · ASP.NET Core Web API · Blazor Server · .NET MAUI · MySQL 8

Two client apps — the Blazor Server web portal and the .NET MAUI mobile app — call one ASP.NET Core Web API over HTTPS REST (JWT-authenticated) and a SignalR WebSocket for real-time job-status push. The API's controllers, hub, and application services depend on three sibling libraries: a dependency-free Domain model, an EF-Core Infrastructure layer (MySQL + local photo storage), and a standalone 3D load-planning rule engine. The one exception to that layering: the in-process AI Assistant calls a self-hosted local Ollama LLM directly over HTTP, bypassing Domain and Infrastructure entirely (dashed border marks it as outside the WarehouseGate solution).
